FOREWORD

The Iowa Crop and Livestock Reporting Service is the Iowa unit of a nation-wide organization which is entrusted with the responsibility of operating a standard statistical service for agriculture. The Division of Agricultural Statistics is a division of the Iowa State Department of Agriculture working in cooperation with the Agricultural Marketing Service of the United States Department of Agriculture. The year 1939 marked the one-hundredth anniversary of the collection of statistics of agriculture in the United States.

The general program of the Iowa Crop and Livestock Reporting Service is to meet the public needs and demands for summary data of an historical nature and for current statistical information of agricultural production in Iowa and the United States.

In recent years, there has been an increasing demand from agricultural organizations, commercial interests, teachers, legislators, and county, state and governmental agencies for agricultural data showing the trends of change in counties. Little has been done in the past to make available data for each county over an extended period of time. So urgent is the need for county data that some organizations have assembled such information at considerable cost. It is in response to these needs that this series is being issued.

The county data herein offered have been assembled from existing State and Federal documents and reports, under the supervision of Norman V. Strand, State-wide Work Projects Administration Supervisor of Agricultural Economics and Statistics projects. This is a report of work completed on Official Project 65-1-72-155 of the Work Projects Administration. Official Project 65-72-3-36 furnished the material for Tables 26 and 28.

The Iowa Agricultural Extension Service participated in the preparation of the materials in this report. Selected data from the files of the Iowa Agricultural Experiment Station have been released for publication in this series. Special credit is given to the Iowa assessors and tax officials who collect data on crops and livestock as required under the Iowa laws. Without these data by townships and counties detailed agricultural statistics would be less accurate and less complete.

Leslie M. Carl, Director
Division of Agricultural Statistics

Des Moines, Iowa
December, 1940

IOWA AGRICULTURAL STATISTICS - BOONE COUNTY

This county is slightly west of the geographical center of the State. It is another county formed from the old Benton County strip that was established by the Wisconsin Territorial Legislature on December 21, 1837. 1/ It was formally created as a part of the State by the act of the Iowa Legislature in January, 1846, and named for Captain Nathan Boone who commanded a company of Rangers which explored the Des Moines and Boone River valleys in 1832.

Lysander W. Babbitt, a young man with the expedition, and two companions came back into the Boone valley early in 1842. After hunting and exploring for several months they came to the present site of Moingona where they found the ruins of an Indian village. They made claims here and stayed until 1844, when they returned to more settled country because the roving bands of Indians had robbed them of their furs and threatened their lives. They were the first white men to make their homes in Boone County.

The county was regularly organized in 1849, but it was attached to Polk County for judicial and administrative purposes. A town sprang up on the site selected for the county-seat and was named Boonesboro, which soon became the principal town in the county. 2/

In 1865 the Cedar Rapids and Missouri River Railroad was extended to the new town of Montana, one mile east of Boonesboro. The Railroad Company demanded a large bonus from the county-seat to secure the line, but Boonesboro, feeling secure, declined to pay it. As a result the road was turned southwest, entirely missing the town. A long and bitter struggle ensued, but the town of Boone, as Montana came to be called, won and the town of Boonesboro became a suburb of the new city. 3/

A portion of the Des Moines River valley near Boone has been set aside and named Ledges State Park. The rugged grandeur of towering, rocky bluffs and timbered hills, with the added attraction of a zoo, an outdoor museum, and picnic conveniences, attract many thousand visitors yearly. 4/

Boone County is rich in places of historical interest. Pilot Mound, in the northwestern part, was used by the early settlers as a signal hill; when the residents of the region were to be summoned for any special purpose big fires were kindled on its top to attract their attention. A terrific Indian battle was fought here and many bodies of the fallen braves were buried on its summit. 5/

5/ Ibid. p. 403.

Another point of interest is High Bridge, near Madrid. This bridge, 2,474 ft. in length and 145 ft. high, is the highest in the state. 6/

In addition to its wealth of agricultural, livestock and manufactured products, Boone County ranks among the leading coal producers of the State. In 1936 it ranked fourth in the State, producing 488,314 tons. 7/

Area

Boone County is 24 miles square, containing 569 square miles. 8/ It contains 364,160 acres, of which 345,502 are listed as farm lands. 9/ The county contains sixteen Congressional and seventeen civil townships. The two central tiers of townships are unequal in area because their boundaries conform to the Des Moines River. It ranks thirty-fourth in the State in point of size --sharing this position with Hardin, Jones and O'Brien counties.

Soils

The soils of Boone County are grouped into three classes according to their origin and location; namely, drift, terrace, and swamp and bottom-land. The drift soils cover 93.3 percent of the surface of the county and are divided into Carrington loam--40.4 percent, Clarion loams--20.6 percent, Webster loams--27.4 percent, and Conover silt loam--4.9 percent. The terrace soils cover 1.9 percent of the surface and are divided into Buckner loams--0.8 percent, Buckner loamy fine sand--0.1 percent, O'Neill loams--0.6 percent, and Waukesha loam--0.4 percent. The swamp and bottom-land soils cover 4.8 percent of the area and are divided into Wabash loams--3.0 percent, Sarpy silt loam--0.8 percent, and peat and muck--1.0 percent. 10/

Topography

Topographically, the larger part of Boone County is a level to gently rolling prairie. However, a wide variety of surface features are found within its boundaries. The Des Moines River follows a winding course southward near the center of the county. Its deep, narrow, wooded valley, scarcely more than a mile in width at any point, varies in depth from 130 to 250 feet below the general upland level. Tributary streams have cut valleys and ridged the bordering territory, thereby creating a steep, hilly and, in many places, rough condition within several miles on either side of the main channel.

The Des Moines River system drains all but the northeastern part, which is served by Squaw Creek and several tributaries which join the Skunk River in Story County. Considerable areas of flat, level land also exist. Drainage is poor on these tracts and tiling is necessary to make the land workable and productive. 11/

Climate

The average temperature for 37 years (1893-1930) was 48.2 degrees. The average precipitation for 59 years (1871-1930) in this county was 32.88 inches, and the growing season averaged 160 days between the killing frost dates of May 7 and October 4, recorded over a period of 37 years. 12/

Population

Boone is another Iowa county that has experienced very little recession in its population growth. With the advent of the railroad in 1865, the population increased very rapidly. This was the era of its greatest increase, but it has had a fairly steady growth since. The rural population has shown a decline, however, attributable to the mechanization of farms and the consequent demand for fewer farm laborers.

The following table shows the number of inhabitants recorded at 10-year intervals:

<u>Year</u>	<u>Inhabitants</u>	<u>Urban</u>	<u>Rural</u>
1850	735	-	-
1860	4,232	-	-
1870	14,484	-	-
1880	20,838	-	-
1890	23,772	-	-
1900	28,200	11,209	16,991 <u>13/</u>
1910	27,626	13,850	13,776
1920	29,892 <u>14/</u>	17,028 <u>15/</u>	12,864
1930	29,271 <u>16/</u>	16,559	12,702
1935	-	-	10,557 <u>17/</u>

In 1930, the total foreign born and mixed parentage content of Boone County comprised about 31.7 percent of the population. The Swedes led with 3,348, the Germans came next with 2,079, and England, Scotland and Italy were well represented with 719, 588 and 255, respectively. 18/

Cooperatives

In 1937, there were 5 cooperative institutions in operation in this county--4 elevators and 1 livestock enterprise.

The 4 concerns which reported had 596 members, of which 411 were active, and 1,680 persons patronized them during the year. The selling cooperatives had a business volume of \$864,370 and the purchasing cooperatives transacted \$51,729 worth of business.

Cooperatives may both buy and sell or they may perform one or the other function exclusively. Purchasing cooperatives buy non-farm commodities for distribution to their members and patrons, and selling cooperatives market farm commodities for their members and patrons. 19/

Fruit

The best year for apples was in 1884, when 51,901 trees yielded 46,290 bushels. Plums also were at their peak of production that year, with 6,087 trees and 3,579 bushels being recorded. In 1909, 13,029 cherry trees produced a record crop of 1,545 bushels. This was also the best year for grapes, as 19,572 vines were credited with 118,057 pounds. Peaches have never been of any importance. 20/

Note Regarding Yields of Corn

The crop assessors' statistical breakdown for corn acreage is as follows: (1) all corn, (2) corn husked for grain, (3) corn cut for silage, (4) corn cut for fodder and (5) corn hogged off. A total production is given for each farm which includes only that actually husked. In getting county totals of production, the acreage other than that husked is multiplied by the yield (derived by dividing total bushels corn husked by total acres husked) and added to summations of individual farm productions shown as husked. This assumes that acreage not husked would have produced the same yield as that actually husked.

In 1934 and 1936, both poor crop years, separate estimations of corn yield on acreage not husked were made by the State assessors' office because it was felt that farmers in those years would select their best acreages for husking and cut or hog off the rest, which would have a different and lower yield. This separate yield estimation was then multiplied by the acreage not husked and the total added to that reported as husked.

This was done by counties only and not by townships. The township yields for these two years, then, are somewhat high since they are based only on acreage husked for grain and bushels husked. The total corn acreage is shown by township with this yield, and any attempt to multiply it by the acreage shown to get total production will result in a too high figure. The county summary table figures for corn yield in 1934 and 1936 have been adjusted for poorer yields on that acreage not husked and these yields may legitimately be multiplied by the acreages shown there to arrive at total productions for the county.

In all other years actual township productions may be derived from the yield and acreage figures shown in the tables since corn yield has been assumed to be equal in all utilizations. The county yield and township yields are, therefore, consistent in all years except 1934 and 1936.

1938	44,382	13,800	8,236	778	7,641	68,127
1939	44,382	13,469	7,627	727	6,445	74,662

The figures in this table for the years 1870-1935 inclusive have been derived from the Federal Censuses for Iowa. These enumerations have been made as of different dates. Some enumerations were for a base date of January 1, others for a base date of April 1, and others for June 1.

The census enumerations made in 1920, 1925 and 1935 were for January 1. For comparability the enumerations made for the base dates of April 1 and June 1 were adjusted to an equivalent of January 1 base. This adjustment procedure places the livestock data of the above table on the one inventory date of January 1.

The figures for 1936, 1937, 1938 and 1939 for all cattle and milk cows are estimates of the Division of Agricultural Statistics of the Iowa Department of Agriculture and those for horses, mules, hogs and sheep are adjusted State farm assessors' figures.

The adjusted county figures for horses, mules, hogs and sheep for the last four years in the table are more nearly accurate than those in Table 22 and comparison with these figures will provide an estimate of the bias displayed by the unadjusted State farm assessors' figures.

*Includes Milk Cows.

The statistics in this table are biased downward. They are printed only to permit inter-township and inter-annual comparisons. Unless townships are equal in size, comparisons may not be directly made. It is assumed that individual assessors are subject to approximately the same bias. Compare Table 21 for magnitude of the bias.
